

Exercise 01: Npgsql

dr Szymon Murawski

March 17, 2020

In this exercise you will practice connecting and accessing database resources using Npgsql package. Your program should use the rental database we used during laboratories. You can review the topics we discussed during laboratories by looking at the following repository: <https://github.com/Mishrakk/DBS2/tree/master/NpgsqlIntroduction>

1. Create a program, that at the start displays a list of all movies: their ids and titles.
2. Move the connection string (if you already didn't) to the configuration file.
3. Ask the user for `movie_id` of title for which more details should be displayed: year of production and age restriction
4. Also display all actors that are starring in the movie
5. Also display all the copies of the movie
6. Also display status of those copies - are they rented and if so to who?
7. Add an option for the user to create a new copy of a movie
8. Add an option for the user to create a new movie
